51 Population statistics, Greece

Please note that population statistics (i.e., demographic projections of current statistics based on Census data) are not produced by the National Statistical Service of Greece at sub-country level (regions and degrees of urbanization), and not at all for education levels. Population statistics for these characteristics are available only in reference to the Census year (2001). Note also that the age x gender projections are based on Census 1991 data. Projections based on the recent Census 2001 have not been released as yet.

Please note that the 14 numbers, made available by the National Statistical Service of Greece, have been adjusted to reflect the exclusion of the Cyclades islands and the Dodecanese islands (except of the island of Rhodes) from the target population of the survey. The adjustment involved the uniform (for all 14 groups) reduction of the projections by 1.67%, which was the portion of the excluded population in the recent National Census of Population 2001.

1) The available age x gender projections of current statistics are the following:

51 Population Statistics, Netherlands

distributions of population characteristics, used for calculating the weight factor

These distributions have been derived from Dutch Statistics, which collects census information directly from the registers of all Dutch municipalities, and from the Gfk mini census, that collects information from accumulated samples.

3) Highest obtained education, for the whole country – for population older than 15 years

The data of highest obtained education is not yet available for the national census of 2000. Therefore we propose the data of a survey in 2002. The population of this survey excludes people younger than 15 years old. Therefore the total numbers are not the same as of the statistic above (gender x age).

3) Highest obtained education, for the whole country – for population older than 15 years

The data of highest obtained education is not yet available for the national census of 2000. Therefore we propose the data of a survey in 2002. The population of this survey excludes people younger than 15 years old. Therefore the total numbers are not the same as of the statistic above (gender x age).
